Home : 4th alley/D.mogadas st. Urmia/Iran

Date of birth : 11th June 1993

Education

Bachelor of science

Tabriz Art University, Tabriz, Iran

Dissertation: "Zangar Museum"

Supervisor: DR. Hashempour

Experience

Bachelor's degree in Architecture.

5+ years architectural design experience.

Experience with 3dsmax is required and other design presentation software preferred

HONOURS AND AWARDS

Ranked 1st in BnW photography competition

in MAR 2014 for Tabriz Art University

HONOURS AND AWARDS

Ranked 2nd in Land Scape design competition
in April 2015 for Tabriz Art University.

Ranked 1st among class graduates for final
dissertation "Zangar Museum" in the Architectur
Department of Tabriz Art University.

My Photography Story

I was fond of photography from childhood, and I remember playing with my old camera at that time and pretending to be taking the photo of my family. As a time passed and the bigger I got, I bought a digital camera for myself, but that camera was not so efficient, so I could not take the pictures I had in my mind. So I got to the camera of my phone and started to take pictures of it.

After a while, I realized that I was interested in black and white photos and began to learn how to get good one. I liked them because they are very honest with us as well as they do not lie to our eyes, they do not deceive us, and also black and white photos are very clear and glassy, such as the fresh water of a fountain.

Sculpture

Bosom

The Bosom sculpture was the winner of the sculpture contest with the theme of family in Tabriz. In process of making this sculpture, I used the abstract concepts of relationship and deep love of the father to the son. As you can see Father with his instinctive fears his son in the chest. He cares and does not want to let him enter the real world. This has a deep root in wrong tradition of raising children, especially in the Third World countries.

Zangar Museum

Zangar museum is my final design for Tabriz art university, supervised by prof Parissa hashempour. The main purpose of designing this project was building a specific place for displaying hardships of Tabriz people through last three governments that ruled country approximately over a century.

In this museum I have tried to cast a light on difficulties people must under go because of dictatorial policy in the area. So that, I decided to use three different forms which combined together as a candidate of three different period of Tabriz history. In addition, I was of the opinion that in a way of showing the attitudes of people, using a sharp edge forms could be logical.

Concept

The basic concept of Zangar museum was the combination and effects of three period of Tabriz police that Tabriz had seen over a century and showing them by sharp edge forms to connect better with title of museum.

Concept

The second idea is designing dark environments in order to show up the dark atmosphere of society in a last three time period. In this way, visitors would have better connection with interior structure.

Political History of Iran

The history of Iran, commonly also known as Persia in the Western world, is intertwined with the history of a larger region, also to an extent known as Greater Iran, comprising the area from Anatolia, the Bosphorus, and Egypt in the west to the borders of Ancient India and the Syr Darya in the east, and from the Caucasus and the Eurasian Steppe in the north to the Persian Gulf and the Gulf of Oman in the south.

Qajar

The Qajar rulers were members of the Kogajar or Black Goat' sect of the Qajars, who themselves were members of the Konyagall or Shad-Nak lineage of the Qajars. Tabriz[1][2][3] Qajars first settled during the Mongol period in the vicinity of Aras and were among the senior Qashqairi tribes that supported the Safavids.[4] The Safavids left Iran present-day Republic of Azerbaijan to local Turkic Khan[5] and in 1664 Garja was governed by Shahverdi Sultan Ziyadoghlu Qajar, whose family came to govern Kuzestan in southern Iran[6][7]

Pahlavi

The earliest attested use of Pahlavi dates to the reign of Artaban I of Parthia (250 BC). In early Parthian coins with Pahlavi script[8] There are also several Pahlavi texts written during the reign of Artaban I (c. 170-180 BC)[9]. The oldest of the library, at Whitehead, had near-modern day Achaemenid thousands of pottery shards with brief words, several of which that are fully dated bear reference to members of the immediate family of the king

Islamic republic

Iran is home to one of the world's oldest continuous major civilizations, with historical and urban settlements dating back to 7000 BC.[1] The southwestern and western part of the Iranian Plateau participated in the traditional Ancient Near East with Elam, from the Early Bronze Age, and later with various other peoples, such as the Kassites, Mannaeans, and Gutians. Georg Wilhelm Friedrich Hegel names the Persians as the first Historical People.[2] The Medes unified Iran as a nation and empire in 625

Archaeological studies indicate that the art of tying knots dates back to prehistoric times. Recent discoveries include 800,000-year-old bone needles used for sewing and loom kits, which were used to weave knots. However, due to the delicate nature of the medium, few examples of prehistoric Chinese knotting exist today. Some of the earliest evidence of knotting has been preserved on bone records of the Xia Dynasty period (4000-2000 BCE), but direct carvings of the Northern Dynasties period (386-581) and on silk paintings during the Western Han period (206 BCE-9 CE).

Further references to knotting have also been found in literature, poetry and the private letters of some of the most famous rulers of China. In the 18th century, one novel that talked extensively about the art was Dream of the Red Chamber.

Architecture school

Architecture school

Through over a decade of research and practice in strategic resource use, ERS knows that strategic schools start with a strong vision for student and teacher success, and then they deliberately reorganize resources — people, time, technology, and money — around that vision. We call this Strategic School Design. Explore our many tools and stories, and discover all that school leaders can do to improve teaching and learning.

The architecture school design is based on providing unique views and spaces for architecture students in order to encourage their spirit for architectural courses.

In addition, the spaces and a structure itself must reflect the Iranian culture and Tradition in order to connect structure and Iranian culture.

CONCEPT

The main concept of the form is combination between modern and deconstruction architecture with Iranian traditional schools which back to GAJAR person in Iran. In this project, I have tried to import Iranian central grand yards to project as place for resting and relaxing. Besides, the combination of forms bring a various perspective view for students which plays an important role in their mental function during education.

CONCEPT

The second concept is lighting that resembles the ancient lightings in Islamic mosques. Placing Islamic elements toward windows brought us unique shadow castings and extraordinary interior views.

classroom

A classroom is a learning space, a room in which both children and adults learn about things. Classrooms are found in educational institutions of all kinds, from preschools to universities.

gymnasium

A gym, short for gymnasium, is an open air or covered location for gymnastics, athletics, and gymnastic services. The word is derived from the ancient Greek gymnasium (γ) they are commonly found in athletic and fitness centers, and as activity and learning spaces in educational institutions. "Gym" is also slang for "fitness center", which is often an indoor facility.

Restaurant

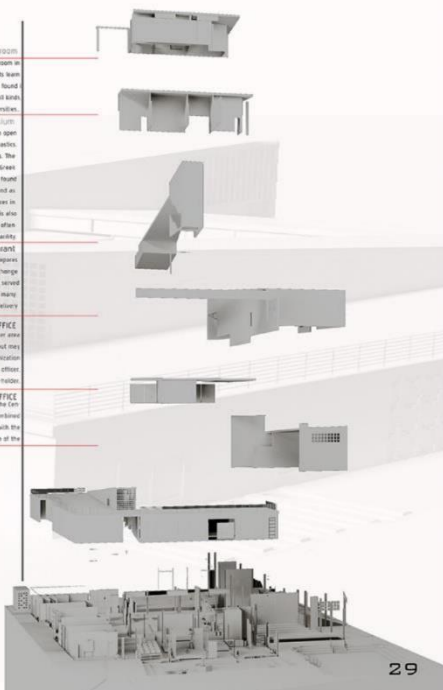

Restaurant, is a business which prepares and serves food and drinks to customers in exchange for money. Meals are generally served and eaten on the premises, but many restaurants also offer take-out and food delivery.

OFFICE

An office is generally a room or other area where administrative work is done, but may also denote a position within an organization with specific duties attached to it (see officer, office holder).

INFORMATION OFFICE

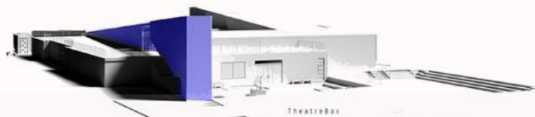

The office was merged in 1941 when the Central Committee and State Council combined the State Council Information Office with the External Propaganda Leading Group of the

The second concept is lighting that resembles the ancient lightings in Islamic mosques. Placing Islamic elements toward windows brought us unique shadow castings and extraordinary interior views.

Main structure

Structure is an arrangement and organization of interrelated elements in a material object or system, or the object or system so organized. [1] Material structures include man made objects such as buildings and machines and natural objects such as biological organisms, minerals and chemicals. Abstract structures include data structures in computer science and musical form. Types of structure include a hierarchy (a cascade of one-to-many relationships), a network featuring many-to-many links, or a lattice featuring connections between

These areas that combine retain their own design nature as independent or interdependent structural areas within the larger combined structural area.

Architecture school

Through over a decade of research and practice in strategic resource use, ERS knows that strategic schools start with a strong vision for student and teacher success, and then they deliberately reorganize resources — people, time, technology, and money — around that vision. Pilgrimages Airport

Pilgrimages Airport

In a world today the necessity for building a specific monument for Tabriz airport especially for Macca pilgrimages has raised instantly.

As a way of solving this problem,

I had decided to design a structure

based on Islamic elements and ideologies in an attempt

to approach this goal. In fact, Tabriz pilgrimages

air port is a coalition to the main

airport in order to reduce passengers density

in the main building. In the other hand, the designed

structure must reflect Islamic culture and

religion for strengthening the relationship

between environment and passengers..

Concept

The main concept that I choose to apply for pilgrimages airport inspired by bird which could be a logical concept for airport design idea.

The second concept of the air port is ascension from the earth and reach the sky to resemble airplanes path from earth to sky. As a way of exposing this idea, the structure of building starts from 0 level and follows ascendant path to sky.

Concept

The last but not the least Concept of the

project concentrated on the upper surface which

is elaborated with Islamic algorithms to cast same shadows in interior areas.

Challenges

The main challenge during Pilgrimages Airport design

process is harsh winds of Tabriz city

Which are hinder the designing throught the area. To come up with this situation I decided to

Use airplanes airodinamic model to solve this problem

and rotate the building right against winds path

Therefore, the structure could easily respite harsh winds..

Islamic Algorithms

The here presented Algorithm of Islamic Jurisprudence connects back some 1.200 years to the origin of the modern term An algorithm which is the most fundamental methodological driver of the current information technology pace at internet speed.

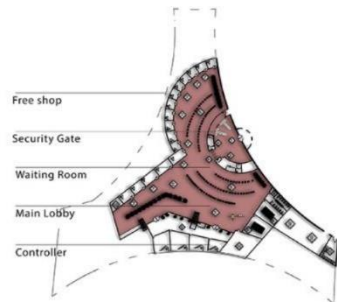

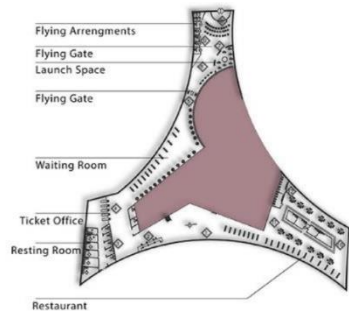

It will be discussed in three major parts which consist of (A) methodological considerations in Islamic Jurisprudence (Fiqh) with regard to (B) Computer.

Science and its underlying mathematics, and a discussion (C) of the practical algorithmic results in computer programming while this introduction shall serve as a brief historical review: It is commonly known that the term Algorithm is a Latin short - version of the name Muhammad Ibn Musa Al Khwarizmi (163-235AH / 780-850AD)...

A section through a padded sail.

CFD in buildings

In early age of construction, the most of building related issues such as ventilation analysis, wind loading, wind environment etc. were conducted by the wind tunnel tests, but today all these test can be done effectively with CFD technique. CFD technique can resolve all above mentioned issues in very short time period and it is very economical as well as strong approach than the older one (experimental). Recently Computational fluid dynamics is used as a sophisticated airflow modelling method and can be used to predict airflow, heat transfer and contaminant transportation in and around buildings. CFD plays an important role in building design.

Rose residential

Rose residential

Rose residential Complex was a project which has to design specifically for High level residence that wants luxury and posts modern house to live. Therefore, the main focus of designing must concentrate on providing Unique form and spaces in order to satisfy the customers. In the other side of this design, the structure itself must have roots in Iranian culture and traditions based on post modernism philosophy. The main idea of Rose residential is brought up from Iranian Ancient houses with sloped ceilings and magnificent windows Which is rotated and stands with Diagrid structure. As a way for reflecting Iranian culture, I import Iranian Algorithms on diagrid structures openings

Concept

The initial concept of the project is brought up from Iranian Ancient houses with sloped ceilings and magnificent windows Which is rotated and stands with Diagrid structure.

Concept

As a way for reflecting Iranian culture,
I import Iranian Algorithms (goel anar)
on diagrid structures openings
Which is rotated and stands with Diagrid structure.

Challenges

Most controversial challenge for Rose residential design is to design specifically for High level residence that wants luxury and posts modern house to live. Therefore, the main focus of designing must concentrate on providing Unique form and spaces in order to satisfy the customers. In the other side of this design, the structure itself must have roots in Iranian culture and traditions based on post modernism philosophy.

As a way for reflecting Iranian culture, I import Iranian Algorithms on diagrid structures openings

Concept

The initial concept of the project is brought up from Iranian Ancient houses with sloped ceilings and magnificent windows Which is rotated and stands with Diagrid structure.

Elevator shaft

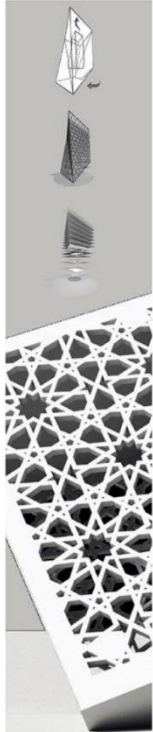

An elevator (US and Canada) or lift (UK, Australia, NZ, India, etc.) is a type of vertical transportation that moves people or goods between floors, basins, decks of a building, vessel, or other structure. Elevators are generally powered by electric motors that either drive a counterweight and four-wheel system like a hoist, or pump hydraulic fluid to raise a cab that glides like a piston.

In agriculture and manufacturing, an elevator lift is any type of conveyor device used to lift materials in a continuous stream into bins or silos. Several types exist, such as chain and bucket elevators, grain auger screw conveyors using the principle of Archimedes' screw, or the chain and paddle or belt of bag elevators.

Languages other than English may have borrowed based on either elevator or lift. Greater lobby at the Forest Glen Washington Metro Station in Silver Spring, Maryland.

Because of wheelchair access laws, elevators are often a legal requirement in new multi-story buildings, especially where wheelchair ramps would be impractical.

Rose residential

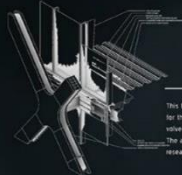

Rose residential

Rose residential Complex was a project which has to design specifically for High level residence that wants luxury and posts modern house to live. Therefore, the main focus of designing must concentrate on providing Unique form and spaces in order to satisfy the customers. In the other side of this design, the structure itself must have roots in Iranian culture and traditions based on post modernism philosophy. The main idea of Rose residential is brought up from Iranian Ancient houses with sloped ceilings and magnificent windows Which is rotated and stands with Diagrid structure. As a way for reflecting Iranian culture, I import Iranian Algorithms on diagrid structures openings.

Concept

The initial concept of the project is brought up from Iranian Ancient houses with sloped ceilings and magnificent windows Which is rotated and stands with Diagrid structure.

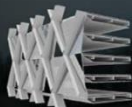

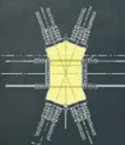

This book explains comprehensively for the first time all of the aspects involved in this new bearing structure. The author, experienced in teaching, research, and practice (recent publica

cross-section

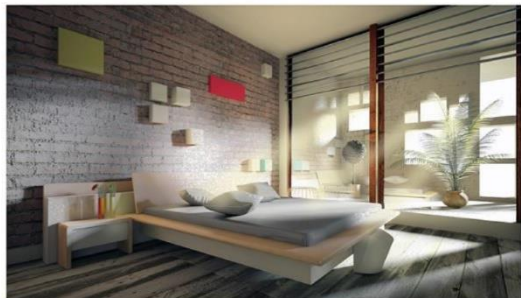

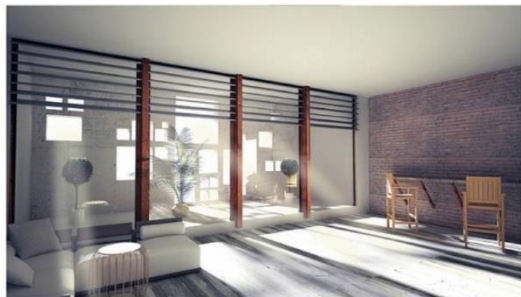

Diagrids are load-bearing structures made of steel diagonal grids. They were first used in the great buildings of the turn of the millennium, such as the Swiss Re Tower in London 'The Gherkin' and the Hearst Magazine Tower in New York City. Diagrids are their emerging popularity not only to their stunning aesthetic value, but also to their very tangible benefits: a massive saving of material, a significant gain in open, usable floor area, and increased flexibility.

The book looks at contemporary diagrid buildings such as Capital Gate (Abu Dhabi), Guangzhou HC (China), Bow Enana (Cairo), CCTV (China) and the Baha Tower (Doha) to establish an understanding of the methodology of the design of this innovative type. At its opening in 2014, The Leadenhall Building in London will be the first

Hedayat School

Hedayat school

The Hedayat School of Urmia, dating back to the late Qajar period, was originally one of the oldest houses in the city and belongs to one of the elders of Qajar II. This historic house was renamed the school in 1347 by the new owner.

Guild school inscriptions have been destroyed, which is why the exact date of construction and the name of the architect is not known, but due to the type of materials and the form of architecture, the date of its construction dates back to the late Qajar period. It was built by the masters and during the First World War, the French have used the foundation of guidance. The most important and most valuable part of the Hedayat School of Urmia is the southern side of the courtyard facing the north and inside the inner and outer courtyards. This monument is based on the traditional Iranian architecture, with a relatively beautiful interior and exterior. The school's courtyards are in quadrangle form with brick walls and stone and brick basements with arches of glazed embroidery bricks. On the south and west sides of the courtyard there are underground buildings that are lower than the yard floor, the materials used in the basement are up to one meter high with gray stones and on the ground floor of the brick.

User changing

The second concept is lighting that resembles the ancient lightings in Islamic mosques. Placing Islamic elements toward windows brought us unique shadow castings and extraordinary interior views.

The conductor's cellar basement has appeared with different functions during its three periods of use

Azaz al-Dawlah's family

During this period, it belonged to the first owner of the building about 120 years ago. The use of underground space was important, not limited to cooking and tanning the house. And a safe place that was used during conflict and conflict between ordinary people and common people used by women and children. He was living in the house.

Hashemf Dil Moghani

In this period, the history of the basement of the house loses its importance to the previous period. It is limited to the tent of a kitchen house and a storehouse for household food storage.

Mr. Mohammad Sahat

During this period, the building faces a significant change in performance that changes from residential to residential. The school's function is to change the name of the school to the high school. Guidance from this period is taken. In the period from the date that the basement of this building was part of Hedayat school. It is merely a function other than the storage of documents and documents relating to education as well as equipment warehouses. He did not have a school janitor, including a bicycle, and so on.

- 5 Museum

Suggested performance

Space design should be such that children, adults and young people are attracted to the opportunity to spend their time in separate spaces with an open plan where studies are carried out. The goal is to provide at least the information tool for each person. Usually in the design of the library, attention should be paid to the use of open, expandable, multi-functional, open-ended, square-shaped sections that are organized horizontally and have attractive inlets. Places used for adults can have 5 or 6 shelves (maximum access, 80/1 m) and children's 4 shelves with an access height of about 1.2 meters. The length of the corridors of the shelves should not exceed 3 meters and should have places to display and put books.

Hedayat school

The Hedayat School of Urmia, dating back to the late Qajar period, was originally one of the oldest houses in the city and belongs to one of the elders of Qajar II. This historic house was renamed the school in 1347 by the new owner.

In the third stage, the side wall of the structure is opened by hinges reinforced with a 60 degree angle to the ground surface.

It should be noted that this only requires two simple people to lift the sandwich style panel up.

In the final phase, the bed and first floor, which are embedded in the west wall, are opened or closed as needed, which in turn increases the performance of the slope cab.

Needless to say, the north side panel of the cabin should be separated from the east side wall before the beds can be opened.

In the second stage, the western side wall of the structure is opened by hinges reinforced with a 60 degree angle to the ground surface.

It should be noted that it only takes two simple people to lift the sandwich-style panel up.

In the fifth stage, as shown in the picture above, the south wall is locked in place to prevent moisture and insects from penetrating the cabin.

The pre-opening cab is a square cube that is easily removable and has all of its components including beds and a kitchen table in the two main walls of the structure.

In the fourth stage, the south side wall, which is reinforced by hinges, is attached to the west side wall, as shown in the figure above, and fastens to its original location.

The Ghost Of Playground

But in this case of design what kind of tree is mimosa ?

Albizia julibrissin is a small deciduous tree growing to 5–16 m (16–52 ft) tall, with a broad crown of level or arching branches. The bark is dark greenish grey in colour and striped vertically as it gets older. The leaves are bipinnate, 20–45 cm (8–18 in) long and 12–25 cm (5–10 in) broad, divided into 6–12 pairs of pinnae, each with 20–30 pairs of leaflets; the leaflets are oblong, 1–1.5 cm (0.4–0.6 in) long and 2–4 cm (0.8–1.6 in) broad. The flowers are produced throughout the summer in dense inflorescences, the individual flowers with small calyx and corolla (except the central ones), and a tight cluster of stamens 2–3 cm long, white or pink with a white base, looking like silky threads. They have been observed to be attractive to bees, butterflies and hummingbirds.[2] The fruit is a flat brown pod 10–20 cm (4–8 in) long and 2–2.5 cm (0.8–1.0 in) broad, containing several seeds inside.

There are two varieties:

Albizia julibrissin var. *julibrissin* – the typical variety, described above
Albizia julibrissin var. *mollis* – differs in the shoots being densely hairy

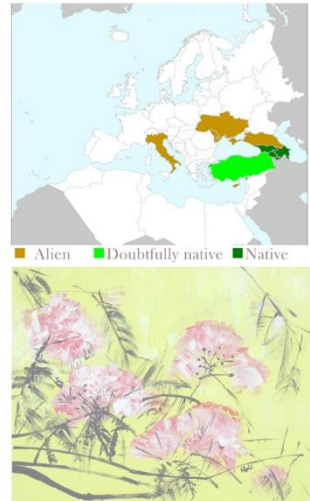

Habitat

Original habitats of the tree include regions from Iran (Persia) and the Republic of Azerbaijan to China and Korea.

A. julibrissin is widely planted as an ornamental plant in parks and gardens, grown for its fine leaf texture, flowers and attractive horizontal canopy. Other positive attributes are a fast growth rate, low water requirements and the ability to thrive planted in full sun in hot summer climates.[5] It is very frequently planted in semi-arid areas like California's Central Valley, central Texas and Oklahoma. Although capable of surviving drought, growth will be stunted and the tree tends to look sickly. As such it should be given infrequent, deep waterings during the summer, which will benefit growth and flowering.

The broad crown of a mature tree makes it useful for providing dappled shade. The flower colour varies from white in *A. julibrissin* f. *alba*, to rich red-tipped flowers. Variants with cream or pale yellow flowers are also reported. Other cultivars are becoming available: 'Summer Chocolate' has red foliage ageing to dark bronze, with pale pink flowers; 'Ishii Weeping' (or 'Pendula') has a drooping growth habit.

Rain water harvesting in the area

In this design approach the rainwater harvesting infrastructure (RHI) management. Similar to any harvesting strategy such as in the farm, infrastructure is important to keep your harvest sustainable until the next harvest. Rainwater, like any other renewable resource, needs to be sustainable because, with human activities, the regular hydrologic cycle is affected by climate change . There are five processes at work in the hydrologic cycle: condensation, precipitation, infiltration, runoff, and evatranspiration . These occur simultaneously and, result in precipitation when the conditions are suitable. Precipitation is a product of condensation of atmospheric water vapor and fall under gravity to the land surface as rain and infiltrates the soil or flows to the ocean as runoff, or surface water (e.g., lakes, streams, oceans, etc.), evaporates, returning moisture to the atmosphere, while vegetation returns water to the atmosphere by transpiration and the cycle continuous

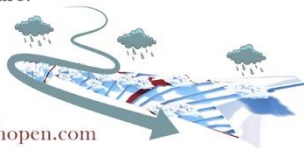

Water flow analysis

Rain water harvesting in the area

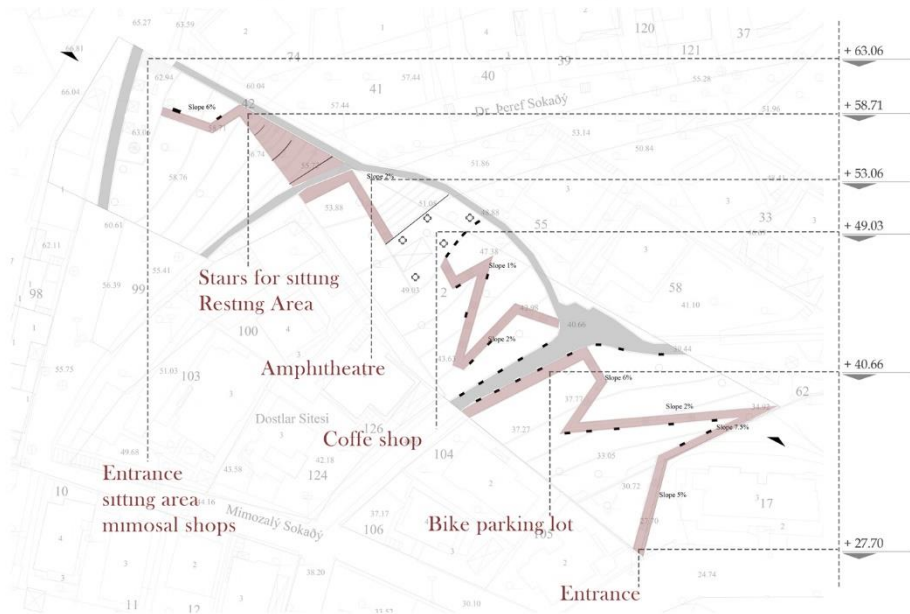

Rainwater harvesting was collection and storage of rainwater for sustainability. Infrastructure is a fundamental physical and organizational structure and facilities that provide services to communities with high-cost investments or capital equipment such as the communal rainwater harvesting that are vital to the country's economic development and prosperity. The infrastructure is essential for any faster economic growth and alleviation of poverty in the country. The presence of an infrastructure (such as water supply, sewerage, roads, public space, electricity, bridges, tunnels, railways, canals, dams, building, airports, etc.) helps in increasing the overall productivity of the country's economy. In this chapter, the infrastructure is rainwater harvesting infrastructure.

Surface water is water on the surface found on wetlands that is nonsaline and is replenished by one of the processes in the hydrologic cycle—precipitation. The surface water supports the replenishment of groundwater aquifer supply if it is channeled efficiently. In most urban areas, the surface water is wasted and polluted. The wasting can be mitigated with proper utilization of surface water from rain via rainwater harvesting and storing it into the aquifer

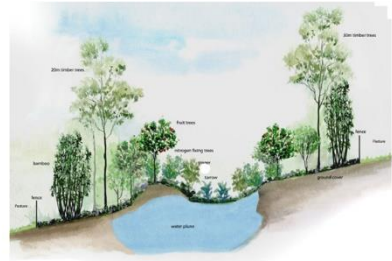

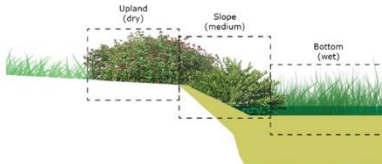

Defining accessibility

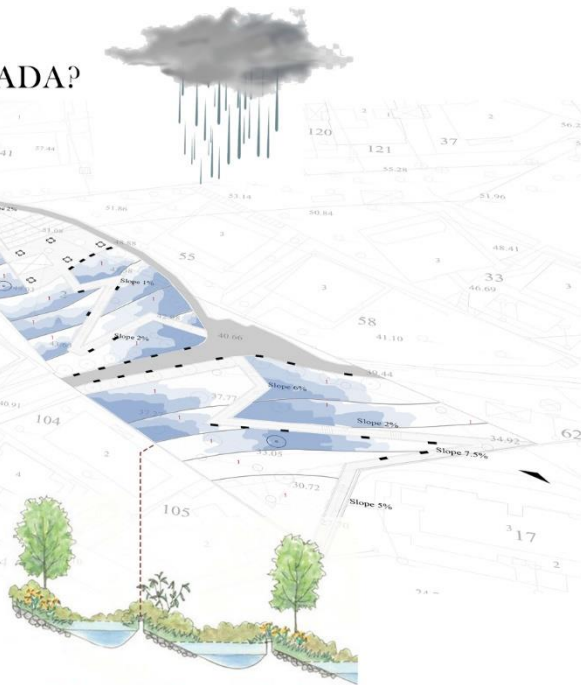

WHY WE SHOULD BUILD RAIN GARDEN ON BUYUKADA?

- Increasing the amount of water that filters into the ground, recharging local and regional aquifers;
- Helping protect communities from flooding and drainage problems;
- Helping protect streams and lakes from pollutants carried by urban storm water – lawn fertilizers and pesticides, oil and other fluids that leak from cars, and numerous harmful substances that wash off roofs and paved areas;
- Enhancing the beauty of yards and neighborhoods; Providing valuable habitat for birds, butterflies and many beneficial insects.

WHY WE SHOULD BUILD RAIN GARDEN ON BUYUKADA?

Below the surface of the garden, a number of processes are occurring which mimic the hydrologic action of a healthy forest. Soils are engineered and appropriate plants selected for the rain garden. The garden is a small bioretention cell in which stormwater is cleaned and reduced in volume once it enters the rain garden. Nitrogen and phosphorus levels and overall sediment loads in the stormwater are reduced by the action of the plants and growing media on the water. Multiple rain gardens over an area will have a positive cumulative effect on both the

Locating Raingardens for each basin

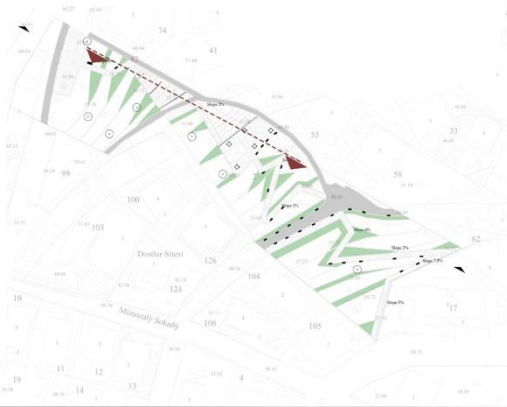

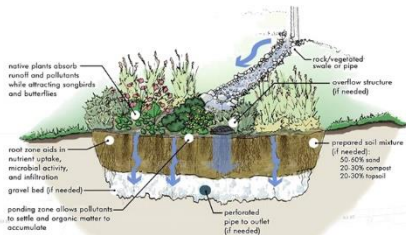

Side section of how basins work

Plant low maintenance trees, shrubs, and perennials along the slope to slow down the runoff and reduce erosion. The plantings will also stabilize the hill and increase wildlife habitats. Biodegradable erosion control netting can be added when planting to prevent any bare spots along the slope.

Bioswales, or linear channels, can deflect water coming from a direct source like a downspout. Rock weirs, or piles of stones intentionally placed to slow down runoff, can help prevent erosion on a hill. Likewise, using stones to create an alpine slide garden with a water feature is a good way to have a rain garden on a slope.

Terraced small rain garden pockets can capture and retain runoff to prevent soil erosion. When space is at a premium, create a straight line of cells. With larger areas, a serpentine design is more appealing. Use native plants and grasses to enhance your rainscape.
